State Finished

Completed on Saturday, 16 March 2024, 9:26 AM

Time taken 32 mins 36 secs

Grade **80.00** out of 100.00

Question 1

Correct

Mark 20.00 out of 20.00

Swap the following two tuples.

tuple1 = (11, 22)

tuple2 = (99, 88)

Expected output:

tuple1 = (99, 88)

tuple2 = (11, 22)

For example:

Input	Result
(11, 22)	(99, 88)
(99, 88)	(11, 22)

Answer: (penalty regime: 0 %)

```

1 a = eval(input())
2 b = eval(input())
3 print (b)
4 print (a)
5

```

	Input	Expected	Got	
✓	(11, 22) (99, 88)	(99, 88) (11, 22)	(99, 88) (11, 22)	✓
✓	(6,4,9) (1,5,2)	(1, 5, 2) (6, 4, 9)	(1, 5, 2) (6, 4, 9)	✓

Passed all tests! ✓

Correct

Marks for this submission: 20.00/20.00.

Question **2**

Correct

Mark 20.00 out of 20.00

Write a Python function that accepts the mail id and breaks the string based on "@" using an appropriate built in function.

For example:

Test	Result
splitstring("Rachel@gmail.com")	['Rachel', 'gmail.com']

Answer: (penalty regime: 0 %)

```
1 def splitstring(email):  
2     a = email.split('@')  
3     print(a)
```

	Test	Expected	Got	
✓	splitstring("Joey@gmail.com")	['Joey', 'gmail.com']	['Joey', 'gmail.com']	✓
✓	splitstring("Rachel@gmail.com")	['Rachel', 'gmail.com']	['Rachel', 'gmail.com']	✓
✓	splitstring("Chandler@gmail.com")	['Chandler', 'gmail.com']	['Chandler', 'gmail.com']	✓

Passed all tests! ✓

Correct

Marks for this submission: 20.00/20.00.

Question **3**

Correct

Mark 20.00 out of 20.00

Write a Python program to find sequences of Lower case letters joined with a '@'.

For example:

Input	Result
saveetha@engineering	Found a match!
saveetha engineering	Not matched!

Answer: (penalty regime: 0 %)

```
1 import re
2 a = (input())
3 b = '[a-z]+'
4 if re.search(b,a):
5     print("Found a match!")
6 else:
7     print("Not matched!")
8
```

	Input	Expected	Got	
✓	saveetha@engineering	Found a match!	Found a match!	✓
✓	saveetha engineering	Not matched!	Not matched!	✓

Passed all tests! ✓

Correct

Marks for this submission: 20.00/20.00.

Question **4**

Correct

Mark 20.00 out of 20.00

Type a couple of words or a short sentence for your variable, then print it using python.

```
my_reason_for_coding=  
print()
```

Answer: (penalty regime: 0 %)

```
1 a = "saveetha engineering college"  
2 print(a)
```

	Expected	Got	
✓	saveetha engineering college	saveetha engineering college	✓

Passed all tests! ✓

Correct

Marks for this submission: 20.00/20.00.

Question **5**

Incorrect

Mark 0.00 out of 20.00

Write a non fruitful and non parameterized function to get two lists and extend the second [list](#) with the first and print the resultant [list](#).

Hint:use eval()

For example:

Test	Input	Result
extendlist()	["python","language"] ["rocks","!!!"]	List1= ['python', 'language'] List2= ['rocks', '!!!', 'python', 'language'] Resultant List=['rocks', '!!!', 'python', 'language']

Answer: (penalty regime: 0 %)

```

1 def extendlist(ResultantList):
2     c = b+a
3     return c
4
5 a = eval(input())
6 b = eval(input())
7 d = extendlist()
8 print (f"List1= {a}")
9 print (f"List2= {d}")
10 print (f"List1= {d}")

```

	Test	Input	Expected	Got	
✖	extendlist()	["python","language"] ["rocks","!!!"]	List1= ['python', 'language'] List2= ['rocks', '!!!', 'python', 'language'] Resultant List=['rocks', '!!!', 'python', 'language']	***Run error*** Traceback (most recent call last): File "__tester__.python3", line 7, in <module> d = extendlist() TypeError: extendlist() missing 1 required positional argument: 'ResultantList'	✖

Testing was aborted due to error.

Your code must pass all tests to earn any marks. Try again.
